1. Introduction

1.1 Overview

AMPAK Technology would like to announce a low-cost and low-power consumption module which has all of the Wi-Fi, Bluetooth functionalities. The highly integrated module makes the possibilities of web browsing, VoIP, Bluetooth headsets applications. With seamless roaming capabilities and advanced security, also could interact with different vendors' 802.11 a/b/g/n Access Points in the wireless LAN.

The wireless module complies with IEEE 802.11 a/b/g/n standard and it can achieve up to a speed of 72Mbps with single stream in 802.11n to connect to the wireless LAN. The integrated module provides SDIO interface for Wi-Fi, UART / PCM interface for Bluetooth.

This compact module is a total solution for a combination of Wi-Fi + BT technologies. The module is specifically developed for Smart phones and Portable devices.

1.2 Product Features

- IEEE 802.11a/b/g/n single-band radio with virtual-simultaneous single-band operation
- Single spatial stream up to a 72 Mbps data rate
- Supports Bluetooth V5.0 with integrated PA for Class 1.5 and Low Energy (BLE).
- Concurrent Bluetooth, and WLAN operation
- Supports standard SDIO v2.0 and SDIO v3.0(SDR50 at 80 MHz and DDR50 at 40 MHz).
- BT host digital interface: UART (up to 4 Mbps)
- IEEE Co-existence technologies are integrated die solution
- ECI — enhanced coexistence support, ability to coordinate BT SCO transmissions around WLAN receives

2. General Specification

2.1 General Specification

Model Name	AP6303BH
Product Description	1T1R 802.11 a/ b/g/n Wi-Fi + BT 5.0 Module
Dimension	L x W : 12 x 12(typical) mm H: 1.7(Max) mm
Wi-Fi Interface	SDIO V3.0/2.0
BT Interface	UART / PCM
Operating temperature	-30°C to 85°C
Storage temperature	-40°C to 105°C
Humidity	Operating Humidity 10% to 95% Non-Condensing

Note: The Optimal RF performance specified in the data sheet, however, is guaranteed only for -20~75°C.

The AP5201 is functional across this range of voltages. Optimal RF performance specified in the data sheet, however, is guaranteed only for 3.2V < VBAT < 3.8V.

2.2 DC Characteristics

2.2.1 Absolute Maximum Ratings

6. Dimensions

6.1 Module Dimensions

Noted: X=1.7

6.2 Recommended footprint

- Solder paste layer design is generally the same as recommended footprint.
(錫膏層設計通常建議和焊墊尺寸相同)
- If soldering quality with good wetting on upright side is essential for PQC, how to optimize the aperture design in the stencil to adjust the amount of solder paste would be crucial.
In addition, a kind of stencil design with stepped thickness in partial area would be considered if the thickness of stencil is about 0.1mm or thinner. Please optimize the stencil design by manufacture engineer or contact AMPAK FAE for assistance.
(如果模組吃錫品質考量側面爬錫，如何優化鋼網開孔設計以調整適當的錫膏量是非常重要的。尤其鋼網的厚度大約是 0.1mm 或更薄時，可考慮局部加厚鋼網的設計。請諮詢製程工程師以優化鋼網的設計,或是聯絡正基科技技術支持團隊)。

8. Host Interface Timing Diagram

8.1 Power-up Sequence Timing Diagram

The module has signals that allow the host to control power consumption by enabling or disabling the Bluetooth, WLAN and internal regulator blocks. These signals are described below.

Additionally, diagrams are provided to indicate proper sequencing of the signals for various operating states. The timing value indicated are minimum required values: longer delays are also acceptable.

- **WL_REG_ON**: Used by the PMU to power up or power down the internal regulators used by the WLAN section. When this pin is high, the regulators are enabled and the WLAN section is out of reset. When this pin is low the WLAN section is in reset.
- **BT_REG_ON**: Used by the PMU to power up or power down the internal regulators used by the BT section. Low asserting reset for Bluetooth. This pin has no effect on WLAN and does not control any PMU functions. This pin must be driven high or low (not left floating).

8.2 SDIO Interface Description

The WLAN section supports SDIO version 3.0, including the new UHS-I modes:

- DS: Default speed up to 25MHz (1.8V signaling), including 1- and 4-bit modes.
- HS: High speed up to 50MH (1.8V signaling).
- SDR12: SDR up to 25MHz (1.8V signaling).
- SDR25: SDR up to 50MHz (1.8V signaling).
- SDR50: SDR up to 80MHz (1.8V signaling).
- DDR50: DDR up to 40MHz (1.8V signaling).

The SDIO interface also has the ability to map the interrupt signal onto a GPIO pin for applications requiring a different interrupt than the one provided by the SDIO interface. The ability to force control of the gated clocks from within the device is also provided.

The following three functions are supported:

- Function 0 Standard SDIO function (max. BlockSize/ByteCount = 32B)
- Function 1 Backplane Function to access the internal system-on-chip (SoC) address space (max. BlockSize/ByteCount = 512B)
- Function 2 WLAN Function for efficient WLAN packet transfer through DMA (max. BlockSize/ByteCount = 512B).
- • Function 3 based on the SDIO Type-A Specification for Bluetooth (max. BlockSize/ByteCount = 256/256B)

8.3 PCM Timing

The PCM Interface on the BCM43456 can connect to linear PCM Codec devices in master or slave mode. In master mode, the BCM43456 generates the PCM_CLK and PCM_SYNC signals, and in slave mode, these signals are provided by another master on the PCM interface and are inputs to the BCM43456. The configuration of the PCM interface may be adjusted by the host through the use of vendor-specific HCI commands.

8.4 UART Timing

The UART is a standard 4-wire interface (RX, TX, RTS, and CTS) with adjustable baud rates from 9600 bps to 4.0 Mbps. The interface features an automatic baud rate detection capability that returns a baud rate selection. Alternatively, the baud rate may be selected through a vendor-specific UART HCI command.

UART has a 1040-byte receive FIFO and a 1040-byte transmit FIFO to support EDR. Access to the FIFOs is conducted through the AHB interface through either DMA or the CPU. The UART supports the Bluetooth 5.0 UART HCI specification: H4, a custom Extended H4, and H5. The default baud rate is 115.2 Kbaud.

The UART supports the 3-wire H5 UART transport, as described in the Bluetooth specification (Three-wire UART Transport Layer). Compared to H4, the H5 UART transport reduces the number of signal lines required by eliminating the CTS and RTS signals.

The BCM43456 UART can perform XON/XOFF flow control and includes hardware support for the Serial Line Input Protocol (SLIP). It can also perform wake-on activity. For example, activity on the RX or CTS inputs can wake the chip from a sleep state.

Normally, the UART baud rate is set by a configuration record downloaded after device reset, or by automatic baud rate detection, and the host does not need to adjust the baud rate. Support for changing the baud rate during normal HCI UART operation is included through a vendor-specific command that allows the host to adjust the contents of the baud rate registers. The BCM43456 UARTs operate correctly with the host UART as long as the combined baud rate error of the two devices is within $\pm 2\%$.

UART Timing

UART Timing Specifications

Ref	Characteristics	Min.	Typ.	Max.	Unit
1	Delay time, BT_UART_CTS_N low to BT_UART_TXD valid	–	–	1.5	Bit periods
2	Setup time, BT_UART_CTS_N high before midpoint of stop bit	–	–	0.5	Bit periods
3	Delay time, midpoint of stop bit to BT_UART_RTS_N high	–	–	0.5	Bit periods

9. Recommended Reflow Profile

1. Referred to IPC/JEDEC standard
2. Peak Temperature : <260°C
3. Cycle of Reflow : 2 times max.
4. Adding Nitrogen (N₂) to implement 2000ppm or less of oxygen concentration during reflow process is recommended.
5. If the shelf time is exceeded, be sure baking step to remove the moisture from the component
